VIRAL POLYMERASE INHIBITORS

TECHNICAL FIELD OF THE INVENTION

The invention relates to inhibitors of RNA dependent RNA polymerases, particularly those viral polymerases within the Flaviviridae family, more particularly to HCV polymerase.

BACKGROUND OF THE INVENTION

About 30,000 new cases of hepatitis C virus (HCV) infection are estimated to occur in the United States each year (Kolykhalov, A.A.; Mihalik, K.; Feinstone, S.M.; Rice, C.M.; 2000; *J. Virol.* 74: 2046-2051). HCV is not easily cleared by the hosts' immunological defences; as many as 85% of the people infected with HCV become chronically infected. Many of these persistent infections result in chronic liver disease, including cirrhosis and hepatocellular carcinoma (Hoofnagle, J.H.; 1997; *Hepatology* 26: 15S-20S*). There are an estimated 170 million HCV carriers world-

wide, and HCV-associated end-stage liver disease is now the leading cause of liver transplantation. In the United States alone, hepatitis C is responsible for 8,000 to 10,000 deaths annually. Without effective intervention, the number is expected to triple in the next 10 to 20 years. There is no vaccine to prevent HCV infection.

Prolonged treatment of chronically infected patients with interferon or interferon and ribavirin is the only currently approved therapy, but it achieves a sustained response in fewer than 50% of cases (Lindsay, K.L.; 1997; *Hepatology* 26: 71S-77S*, and Reichard, O.; Schvarcz, R.; Weiland, O.; 1997 *Hepatology* 26: 108S-111S*).

HCV belongs to the family *Flaviviridae*, genus *hepacivirus*, which comprises three genera of small enveloped positive-strand RNA viruses (Rice, C.M.; 1996; "Flaviviridae: the viruses and their replication"; pp. 931-960 in *Fields Virology*; Fields, B.N.; Knipe, D.M.; Howley, P.M. (eds.); Lippincott-Raven Publishers, Philadelphia Pa. *). The 9.6 kb genome of HCV consists of a long open reading frame (ORF) flanked by 5' and 3' non-translated regions (NTR's). The HCV 5' NTR is 341 nucleotides in length and functions as an internal ribosome entry site for cap-independent translation initiation (Lemon, S.H.; Honda, M.; 1997; *Semin. Virol.* 8: 274-288). The HCV polyprotein is cleaved co- and post-translationally into at least 10 individual polypeptides (Reed, K.E.; Rice, C.M.; 1999; *Curr. Top. Microbiol. Immunol.* 242: 55-84*). The structural proteins result from signal peptidases in the N-

terminal portion of the polyprotein. Two viral proteases mediate downstream cleavages to produce non-structural (NS) proteins that function as components of the HCV RNA replicase. The NS2-3 protease spans the C-terminal half of the NS2 and the N-terminal one-third of NS3 and catalyses *cis* cleavage of the NS2/3 site.

5 The same portion of NS3 also encodes the catalytic domain of the NS3-4A serine protease that cleaves at four downstream sites. The C-terminal two-thirds of NS3 is highly conserved amongst HCV isolates, with RNA-binding, RNA-stimulated NTPase, and RNA unwinding activities. Although NS4B and the NS5A phosphoprotein are also likely components of the replicase, their specific roles are

10 unknown. The C-terminal polyprotein cleavage product, NS5B, is the elongation subunit of the HCV replicase possessing RNA-dependent RNA polymerase (RdRp) activity (Behrens, S.E.; Tomei, L.; DeFrancesco, R.; 1996; *EMBO J.* 15: 12-22*; and Lohmann, V.; Körner, F.; Herian, U.; Bartenschlager, R.; 1997; *J. Virol.* 71: 8416-8428*). It has been recently demonstrated that mutations destroying NS5B activity

15 abolish infectivity of RNA in a chimp model (Kolykhalov, A.A.; Mihalik, K.; Feinstone, S.M.; Rice, C.M.; 2000; *J. Virol.* 74: 2046-2051*).

The development of new and specific anti-HCV treatments is a high priority, and virus-specific functions essential for replication are the most attractive targets for

20 drug development. The absence of RNA dependent RNA polymerases in mammals, and the fact that this enzyme appears to be essential to viral replication, would suggest that the NS5B polymerase is an ideal target for anti-HCV therapeutics.

WO 00/06529, WO 00/13708, WO 00/10573, WO 00/18231, WO 01/47883, WO 01/85172 and WO 02/04425 report inhibitors of NS5B proposed for treatment of

25 HCV.

Included within the scope of this invention are all compounds of formula I as
10 presented in Tables 1 to 8.

Preferred compounds according to this invention are listed in the tables. Particularly compounds of these tables are preferred which show an IC_{50} value of below 200 nM, as for example those compounds included in the claims 51, 52, 53, 54 and 55.

15

Polymerase activity

The ability of the compounds of formula (I) to inhibit RNA synthesis by the RNA dependent RNA polymerase of HCV can be demonstrated by any assay capable of measuring RNA dependent RNA polymerase activity. A suitable assay is described
20 in the examples.

Specificity for RNA dependent RNA polymerase activity

To demonstrate that the compounds of the invention act by specific inhibition of HCV polymerase, the compounds may be tested for inhibitory activity in a DNA dependent
25 RNA polymerase assay.

When a compound of formula (I), or one of its therapeutically acceptable salts, is employed as an antiviral agent, it is administered orally, topically or systemically to mammals, e.g. humans, cattle, pigs, dogs, cats, rabbits or mice, in a vehicle
30 comprising one or more pharmaceutically acceptable carriers, the proportion of which is determined by the solubility and chemical nature of the compound, chosen route of administration and standard biological practice.

For oral administration, the compound or a therapeutically acceptable salt thereof
35 can be formulated in unit dosage forms such as capsules or tablets each containing

a predetermined amount of the active ingredient, ranging from about 25 to 500 mg, in a pharmaceutically acceptable carrier.

For topical administration, the compound can be formulated in pharmaceutically
5 accepted vehicles containing 0.1 to 5 percent, preferably 0.5 to 5 percent, of the active agent. Such formulations can be in the form of a solution, cream or lotion.

For parenteral administration, the compound of formula (I) is administered by either intravenous, subcutaneous or intramuscular injection, in compositions with
10 pharmaceutically acceptable vehicles or carriers. For administration by injection, it is preferred to use the compounds in solution in a sterile aqueous vehicle which may also contain other solutes such as buffers or preservatives as well as sufficient quantities of pharmaceutically acceptable salts or of glucose to make the solution isotonic.

15 Suitable vehicles or carriers for the above noted formulations are described in pharmaceutical texts, e.g. in "Remington's The Science and Practice of Pharmacy", 19th ed., Mack Publishing Company, Easton, Penn., 1995, or in "Pharmaceutical Dosage Forms And Drugs Delivery Systems", 6th ed., H.C. Ansel et al., Eds.,
20 Williams & Wilkins, Baltimore, Maryland, 1995.

The dosage of the compound will vary with the form of administration and the particular active agent chosen. Furthermore, it will vary with the particular host under treatment. Generally, treatment is initiated with small increments until the optimum
25 effect under the circumstance is reached. In general, the compound of formula I is most desirably administered at a concentration level that will generally afford antivirally effective results without causing any harmful or deleterious side effects.

For oral administration, the compound or a therapeutically acceptable salt is
30 administered in the range of 10 to 200 mg per kilogram of body weight per day, with a preferred range of 25 to 150 mg per kilogram.

For systemic administration, the compound of formula (I) is administered at a dosage of 10 mg to 150 mg per kilogram of body weight per day, although the
35 aforementioned variations will occur. A dosage level that is in the range of from

about 10 mg to 100 mg per kilogram of body weight per day is most desirably employed in order to achieve effective results.

When the compositions of this invention comprise a combination of a compound of
5 formula I and one or more additional therapeutic or prophylactic agent, both the compound and the additional agent should be present at dosage levels of between about 10 to 100%, and more preferably between about 10 and 80% of the dosage normally administered in a monotherapy regimen.

When these compounds or their pharmaceutically acceptable salts are formulated
10 together with a pharmaceutically acceptable carrier, the resulting composition may be administered *in vivo* to mammals, such as man, to inhibit HCV polymerase or to treat or prevent HCV virus infection. Such treatment may also be achieved using the compounds of this invention in combination with agents which include, but are not limited to: immunomodulatory agents, such as α -, β -, or γ -interferons; other antiviral
15 agents such as ribavirin, amantadine; other inhibitors of HCV NS5B polymerase; inhibitors of other targets in the HCV life cycle, which include but are not limited to, helicase, NS2/3 protease, NS3 protease, or internal ribosome entry site (IRES); or combinations thereof. The additional agents may be combined with the compounds of this invention to create a single dosage form. Alternatively these additional agents
20 may be separately administered to a mammal as part of a multiple dosage form.

Methodology and Synthesis

Indole derivatives or analogs according to the present invention can be prepared from known monocyclic aromatic compounds by adapting known literature sequences such as those described by J.W. Ellingboe et al. (*Tet. Lett.* **1997**, 38, 7963) and S. Cacchi et al. (*Tet. Lett.* **1992**, 33, 3915). Scheme 1, shown below wherein R^1 , R^2 , Sp , Y and L are as described herein, illustrate how these procedures can be adapted to the synthesis of compounds of formula I of this invention.

SCHEME 1

10

In carrying out the route illustrated in Scheme 1, a suitably protected form of 3-trifluoroacetamido-4-iodobenzoic acid $I(i)$ is reacted with an alkyne $I(ii)$ in the presence of a metal catalyst (e.g. a palladium metal complex such as $PdCl_2(PPh_3)_2$, Pd_2dba_3 , $Pd(PPh_3)_4$ and the like), a base (Et_3N , DIEA and the like or an inorganic

basic salt including metal carbonates, fluorides and phosphates), and optionally in the presence of an additional phosphine ligand (triaryl or heteroarylphosphine, dppe, dppf, dppp and the like). Suitable solvents for this reaction include DMF, dioxane, THF, DME, toluene, MeCN, DMA and the like at temperatures ranging from 20 °C to 5 170 °C, or alternatively without solvent by heating the components together.

Alternatively, the cross-coupling reaction can be carried out on a suitably protected form of 3-amino-4-iodobenzoate and the amino group can be trifluoroacetylated in the subsequent step as described by J.W. Ellingboe et al. (*Tet. Lett.* **1997**, *38*, 7963). Reaction of the above diarylalkynes I(iii) with an enol triflate or equivalent under 10 cross-coupling conditions similar to those described above gives after hydrogenation of the double bond, indole derivatives I(iv). Enol triflates are known and can be prepared from the corresponding ketones by following known literature methods (for example, cyclohexene triflate can be prepared from cyclohexanone, triflic anhydride and a hindered organic base such as 2,6-di-*tert*-butyl-4-methylpyridine). The 15 hydrogenation of the double bond originally present in R³ can be carried out with hydrogen gas or a hydrogen donor (ammonium formate, formic acid and the like) in the presence of a metal catalyst (preferably Pd) in a suitable solvent (lower alkyl alcohols, THF etc.).

The indole derivative I(iv) is then alkylated on nitrogen with an appropriate spacer 20 (Sp) and further elaborated if necessary to give *N*-alkylated indole carboxylates where Y, Sp and L are as defined herein.

Finally, following hydrolysis of the indole ester protecting group, the resulting carboxyindole derivative is converted to compounds of formula 1 by coupling with the appropriate Z group. Condensation of the 6-indolecarboxylic acid with amines or 25 alcohols can be accomplished using standard amide bond forming reagents such as TBTU, HATU, BOP, BrOP, EDAC, DCC, isobutyl chloroformate and the like; or by activation of the carboxyl group by conversion to the corresponding acid chloride prior to condensation with an amine. Any remaining protecting group is removed following this step to give compounds of formula I.1.

30

Alternatively, compounds of formula I.1 can be prepared by elaboration from a pre-existing indole core by following adaptations of literature procedures as described, for example, by P. Gharagozloo et al. (*Tetrahedron* **1996**, *52*, 10185) or K. Freter (*J. Org. Chem.* **1975**, *40*, 2525). Such a methodology is illustrated in Scheme 2:

SCHEME 2

In carrying out the route illustrated in Scheme 2, commercially available 6-
 5 indolecarboxylic acid **2(i)**, which can also be prepared according to the method of S. Kamiya et al. (*Chem. Pharm. Bull.* **1995**, 43, 1692) is used as the starting material. The indole **2(i)** is reacted with a ketone **2(ii)** under basic or acidic aldol-type conditions. Suitable conditions to affect this condensation include strong bases such

as alkali metal hydroxides, alkoxides and hydrides in solvents such as lower alkyl alcohols (MeOH, EtOH, *tert*BuOH etc.), THF, dioxane, DMF, DMSO, DMA and the like at reaction temperature ranging from -20 °C to 120 °C. Alternatively, the condensation can be carried out under acid conditions using organic or mineral acids or both. Appropriate conditions include mixtures of AcOH and aqueous phosphoric acid at temperatures ranging from 15°C to 120 °C.

The carboxylic acid group is then protected in the form of an ester (usually lower alkyl) using known methods. Halogenation (usually bromination, but also iodination) of the 2-position of the indole **2(iii)** gives **2(iv)**. Suitable halogenating agents include, for example, elemental bromine, *N*-bromosuccinimide, pyridine tribromide, dibromohydantoin and the corresponding iodo derivatives. Suitable solvents for this reaction are inert to reactive halogenating agents and include for example hydrocarbons, chlorinated hydrocarbons (DCM, CCl₄, CHCl₃), ethers (THF, DME, dioxane), acetic acid, ethyl acetate, IPA, and mixtures of these solvents. Reaction temperature ranges from -40 °C to 100 °C. A method of choice to carry out the bromination of indoles as shown in Scheme 2 was described by L. Chu (*Tet. Lett.* **1997**, 38, 3871).

The 2-bromoindole derivatives **2(iv)** can be converted to fully substituted key intermediates **1(v)** by different sequences: (1) Trans-metallation of the 2-bromoindole to tin, boron, zinc species and the like, followed by cross-coupling reaction with aryl or heteroaryl halides under transition metal catalysis as described in scheme 1 gives indole derivative **2(vii)** which can then be elaborated on nitrogen as described in scheme 1 to give key intermediate **1(v)**. In this approach, the indoleic NH is optionally protected with known protecting groups such as BOC, MOM, SEM, SO₂Ph and the like. The protecting group is removed at a later stage of the sequence, prior to linker attachment. The conversion of 2-bromoindole derivatives **2(iv)** to the corresponding organotin species **2(vi)** is carried out via initial low-temperature (usually -78 ° to -30 °C) halogen-metal exchange using an alkyllithium reagent (e.g. *n*BuLi or *tert*-BuLi) or using lithium metal. The transient 2-lithioindole species is then trapped with a trialkyltin halide (e.g. *n*Bu₃SnCl or Me₃SnCl) or a borate ester (e.g. trimethyl or triisopropyl borates). Alternatively, the lithioindole intermediate can be trapped with zinc chloride to form the corresponding organozincate which can also undergo transition metal-catalyzed cross-coupling with aromatic and heteroaromatic halides or triflates as described, for example, by M. Rowley (*J. Med. Chem.* **2001**, 44, 1603). Alternatively, species such as **2(vi)** where

the indoleic NH is masked with a protecting group, can be generated directly from **2(iii)** by ester formation followed by indole NH protection and abstraction of the 2-H proton with strong base (e.g. alkyllithiums, alkalimetal amides) followed by trans-metallation. Alternatively, 2-bromoindole **2(iv)** can be cross-coupled directly to aryl and heteroaryl stannanes or boronic acid derivatives to give **2(vii)** directly. Boron or tin organometallic species are from commercial sources or can be prepared by standard literature procedures. (2) In a second approach, 2-bromoindole **2(iv)** is first elaborated on nitrogen to give **2(v)** which is then cross-coupled to R² to give the same intermediate **1(v)** as described above.

- 10 Cross-coupling with organoboron reagents can be carried out by any variations of the Suzuki cross-coupling reaction reported in the literature. This usually involves the use of a transition metal catalyst (usually Pd⁰), triaryl or triheteroarylphosphine ligands, an additive such as an inorganic chloride (e.g. LiCl), and a base (usually an aqueous inorganic base such as sodium or potassium carbonate or phosphate).
- 15 The reaction is usually carried out in an alcoholic solvent (EtOH), DME, toluene, THF and the like at temperatures ranging from 25 °C to 140 °C.

Cross-coupling with tin reagents can be carried out by any variations of the Stille cross-coupling reaction reported in the literature. This usually involves the use of a transition metal catalyst (usually Pd⁰), triaryl or triheteroaryl phosphine ligands, and an additive such as an inorganic chloride (e.g. LiCl) or iodide (e.g. CuI). Suitable solvents for this reaction include toluene, DMF, THF, DME and the like at temperatures ranging from 25 °C to 140 °C. Intermediate **1(v)** is then converted to compounds of formula **I.1** as described for Scheme 1.

- 25 Reaction conditions to alkylate the nitrogen of an indole derivative are well known to those skilled in the art and include the use of strong bases such as alkali metal hydrides, hydroxides, carbonates, amides, alkoxides and alkylmetals, in the appropriate solvent (such as THF, dioxane, DME, DMF, MeCN, DMSO, alcohols and the like) at temperatures ranging from -78 °C to 140 °C. An electrophilic form of **Sp** is used for the alkylation of the indole anion. Such electrophilic species include
- 30 iodides, bromides, chlorides and sulfonate esters (mesylate, tosylate, brosylate or triflate).

The mixture was extracted with EtOAc (3 x 100 mL) and the organic extract washed with 5% HCl (100 mL), after (100 mL) and brine (40 mL). After drying over MgSO₄, the residue was purified by flash chromatography using 20% EtOAc – hexane as eluent to give the desired cross-coupled alkyne as a tan solid (0.442 g): MS (ES⁺) *m/z* 348.0 (MH⁺).

Methyl 3-(cyclohexenyl)-2-phenylindole 6-carboxylate:

Dry DMF (4 mL) was added and the suspension degassed with a stream of argon. The enol triflate derived from cyclohexanone, prepared following the procedure described by A.G. Martinez, M. Hanack et al. (*J. Heterocyclic Chem.* **1988**, 25, 1237) or equivalent methods described in the literature (0.802 g, 3.3 mmol, 3 equivalents) was added followed by Pd(PPh₃)₄ (0.086 g, 0.07 mmol) and the mixture was stirred for 8 h at room temperature. DMF was removed under vacuum and the residue purified by flash chromatography using DCM as eluent (0.260 g): MS (ES⁺) *m/z* 332.2 (MH⁺).

After that period, water was added and the precipitate formed was filtered and washed with water (2x). The solid was dissolved in ethyl acetate, dried over anhydrous MgSO₄, filtered and concentrated to dryness to give the crude methoxy analogue as a white solid (~1.7 g).

The crude 3-methoxy-4-nitrocinnamate ester (570 mg, 2.27 mmol) and methylamine
 15 (30 mL of 2M in THF, 60 mmol) were heated in sealed tube at 85 °C for 40 hours. After that period the mixture was cooled to room temperature, concentrated and purified by flash column chromatography, using ethyl acetate in hexane (10 %) as the eluent, to obtain the desired 3-methylamino-4-nitrocinnamate ester (~160 mg).

20 ES⁺ MS *m/z*: 251.0 (M+H)⁺

Intermediate 3-methylamino-4-nitrocinnamate ester (~150 mg) and SnCl₂ dihydrate (950 mg, 4.2 mmol) were dissolved in ethanol (10 mL) and the mixture was stirred at 80° C for 20 hours. The mixture was cooled to room temperature and concentrated

to dryness. The residue was dissolved in ethyl acetate (100 mL) and was slowly added to an aqueous solution of saturated NaHCO_3 and stirred for 30 min. The organic layer was then extracted with ice cold brine, dried over anhydrous MgSO_4 and the solvent was removed under reduced pressure. The residue was purified by
5 flash column chromatography (using a gradient from 70 % to 60 % of hexane in ethyl acetate) to give the pure diamino cinnamate ester as a yellow solid (100 mg). ES^+ MS m/z : 221.0 ($\text{M}+\text{H}$)⁺

The above diamino intermediate (100 mg, 0.45 mmol) was suspended in CH_2Cl_2 (5 mL) and the aminocyclobutyl acid chloride prepared from
10 1-aminocyclobutanecarboxylic acid, following a similar procedure to that described in example 20 (77 mg, 0.45 mmol) was added. The reaction mixture was stirred at room temperature for 2 hours and then concentrated to obtain a white solid. The solid was then dissolved in acetic acid (5 mL) and heated to 60 °C for 16 hours. The reaction mixture was cooled and the precipitate formed was filtered and washed with
15 cold acetic acid, and then dissolved in ethyl acetate (100 mL) and washed with aqueous saturated NaHCO_3 (2x) and ice cold brine. The organic layer was dried over anhydrous MgSO_4 and the solvent was removed under reduced pressure to give the title compound of example 15b (E)-3-[2-(1-amino-cyclobutyl)-3-methyl-3H-benzimidazol-5-yl]-acrylic acid methyl ester as a white solid (58 mg).

20 Note: it will be apparent to the person skilled in the art that the (carbethoxymethylene)triphenylphosphorane used in this procedure can be replaced by appropriately substituted derivatives to prepare analogues bearing various substituents on the cinnamate double bond. In addition, cinnamate methyl esters can also be prepared in an analogous fashion using the appropriate reagent.

Example 15c: 2-(1-Amino-cyclobutyl)-1H-benzoimidazole-5-carboxylic acid methyl ester

- Methyl 3,4-diaminobenzoate (320 mg, 1.9 mmol), the SEM-protected
- 5 cyclobutylamino acid (500 mg, 1.9 mmol) of example 21 and TBTU (836 mg, 2.2 mmol) were dissolved in CH_2Cl_2 (10 mL) and DIPEA (1.1 mL, 6 mmol) was added. The reaction mixture was stirred at room temperature for 20 hours, then diluted with ethyl acetate (100 mL) and extracted with aqueous saturated NaHCO_3 (2x) and brine. The organic layer was dried over anhydrous MgSO_4 and filtered, and the
- 10 solvent was evaporated under vacuum to isolate the crude amide intermediate as a yellow oil (407 mg). The amide was dissolved in acetic acid (10 mL) and stirred at 70 °C for 3 hours to induce dehydration and cyclization to the benzimidazole. The reaction mixture was concentrated to dryness, diluted with ethyl acetate (100 mL) and washed with 10% aqueous citric acid (2x), aqueous saturated NaHCO_3 and
- 15 brine. The organic layer was dried over MgSO_4 , filtered and concentrated to dryness. The residue was purified by flash column chromatography, using a solvent gradient of hexane in ethyl acetate (from 80 % to 50 %), to give the SEM-protected benzimidazole intermediate as a pink solid (574 mg). ES^+ MS m/z : 390.2 ($\text{M}+\text{H}$) $^+$
- The protecting group was then removed by dissolving this solid in TFA/ CH_2Cl_2 (2 mL,
- 20 1:1 ratio) and stirring the solution at room temperature for 2 hours. The solution was evaporated to dryness under vacuum to give the products, 2-(1-amino-cyclobutyl)-1H-benzoimidazole-5-carboxylic acid methyl ester, which was used for the synthesis of inhibitors without further purification.

EXAMPLE 20

General procedure for coupling α,α -disubstituted amino acids to aromatic amines:

Ethyl (E)-3-[4-(2-amino-2-methyl-propanoylamino)-phenyl]-acrylate:

- Adapting the procedure described by E. S. Uffelman et al. (*Org. Lett.* **1999**, *1*, 1157), 2-aminoisobutyric acid was converted to the corresponding amino acid chloride hydrochloride: 2-oxazolidinone (12.30 g, 0.141 mole) was dissolved in MeCN (150 mL) and phosphorous pentachloride (49.02 g, 0.235 mole, 1.7 equivalent) was added in one portion. The homogeneous mixture was stirred for 24 h at room temperature. 2-Aminoisobutyric acid (14.55 g, 0.141 mole) was added and the suspension was stirred for 48 h at room temperature. The desired acid chloride hydrochloride was collected by filtration, washed with MeCN and dried under vacuum. Other α,α -disubstituted amino acid chloride hydrochlorides can be prepared in an analogous fashion starting from the corresponding amino acid (e.g. 1-aminocyclobutanecarboxylic acid, 1-aminocyclopentanecarboxylic acid, 1-aminocyclohexanecarboxylic acid and the like).
- The acid chloride (12.778 g, 80 mmol, 1.4 equivalent) was suspended in DCM (200 mL) and ethyl 4-aminocinnamate (11.045 g, 57.7 mmol, 1 equivalent) was added. Pyridine (7.01 mL, 86.6 mmol, 1.5 equivalent) was added drop wise and the mixture was stirred for 3.5 h at room temperature. The reaction was then poured into a mixture of 1N NaOH (25 mL) and saturated aqueous NaHCO₃ (100 mL) and extracted with EtOAc. The organic phase was washed with aqueous NaHCO₃, water and brine, and dried over MgSO₄. Removal of solvent under reduced pressure gave the title compound as a white solid (15.96 g, 101% yield).

EXAMPLE 21

Ethyl (E)-3-(4-[[1-(1-amino-cyclobutyl)-methanoyl]-amino]-phenyl)-acrylate:

Diethyl 1,1-cyclobutanedicarboxylate (20.00 g, 100 mmol) and KOH (6.60 g, 100 mmol) were refluxed in EtOH (100 mL) for 2 h. After cooling to room temperature, volatiles were removed under reduced pressure and the residue partitioned between
 5 Et₂O and 4N HCl. The organic extract was washed with water and brine, and dried over MgSO₄. Removal of the solvent under reduced pressure gave the monoester as a clear oil (14.45 g, 84% yield).

The monoester from above (14.45 g, 84 mmol), Et₃N (14.1 mL, 100 mmol) and diphenylphosphoryl azide (DPPA) (24.05 g, 87.4 mmol) were dissolved in dry toluene

Toluene was then removed under reduced pressure and the residue dissolved in DCM. The solution was washed with water and brine and dried over MgSO₄. Concentration under reduced pressure gave a dark oil which was
 15 purified by passage through a pad of silica gel using 30% EtOAc in hexane as eluent. The desired carbamate was obtained as a clear yellow liquid (21.0 g).

The carbamate from above (1.50 g, 5.22 mmol) was dissolved in THF (5 mL) and 2N NaOH (5 mL) was added. The mixture was stirred at 70 °C for 1 h. Following dilution with water, the aqueous phase was washed with Et₂O to remove unreacted
 20 starting material. The aqueous phase was then acidified with KHSO₄ and the product extracted with EtOAc. The desired free carboxylic acid was obtained as an oil (1.25 g).

The acid from above (0.519 g, 2.0 mmol) was dissolved in DCM (10 mL). DIEA (1.39 mL, 8.0 mmol, 4 equivalents) was added, followed by ethyl 4-aminocinnamate
 25 (0.573 g, 3.0 mmol, 1.5 equivalent) and HATU (1.143 g, 3.0 mmol, 1.5 equivalents). The mixture was stirred at room temperature for 3 days. The reaction was poured into TBME (100 mL) and the solution washed successively with 10% aqueous citric acid (2 x 25 mL) and saturated aqueous NaHCO₃ (25 mL), and dried over MgSO₄. The solvent was removed under reduced pressure and the residue stirred with TFA
 30 (10 mL) for 30 min. Volatiles were then removed under reduced pressure and the

residue was co-evaporated twice with hexane. The crude product was dissolved in TBME (60 mL) and the solution washed with 1N NaOH (2 x 25 mL). After drying (Na₂SO₄), volatiles were removed in vacuum to give the title compound as a beige solid (0.500 g).

EXAMPLE 22***Methyl (Z)-3-[2-(1-amino-cyclopentyl)-1H-benzoimidazol-5-yl]-acrylate:***

Diazomethane was slowly added to a solution of 4-chloro-3-nitrocinnamic acid in CH₃OH/CH₂Cl₂ until the yellow color persisted, indicating the presence of excess diazomethane. The solution was evaporated to dryness under reduced pressure and the residue was dissolved in DMSO. The solution was heated to 140 °C and ammonia gas was bubbled through for a period of 4 hours. The mixture was cooled to room temperature and degassed with N₂, and poured onto ice. The solid was dissolved in ethanol (40 mL), SnCl₂.dihydrate (9.91 g, 43.9 mmol) was added and the reaction mixture was heated to reflux for 4 hours. The solution was concentrated to remove most of the ethanol, diluted with EtOAc and saturated aqueous NaHCO₃ was added slowly. The mixture was stirred for 20 min, the organic layer was extracted with brine, dried over anhydrous Na₂SO₄ and evaporated to dryness under reduced pressure. The residue was purified by flash column chromatography (using 50% to 70% EtOAc in hexane) to give the diamino intermediate as a yellow solid (1.03 g).

A portion of the 3,4-diaminocinnamate ester (186 mg, 0.970 mmol) and N-Boc-1-aminocyclopentane-1-carboxylic acid (222 mg, 0.970 mmol) were coupled in the presence of HATU / DIEA (in the usual way) and the amide product formed was dehydrated by heating at 65 °C in a solution of acetic acid (4 mL). The reaction residue was purified by reversed HPLC to give the N-Boc protected (Z)-3-[2-(1-amino-cyclopentyl)-1H-benzoimidazol-5-yl]-acrylic acid ethyl ester.

The Boc protecting group was removed with 4N HCl in dioxane in the usual way to

EXAMPLE 26

4-(4-Ethoxycarbonyl-thiazol-2-yl)-phenyl-ammonium chloride:

25 para-Bromoaniline (13.0 g, 76 mmol) and Boc₂O (19.8 g, 91 mmol) were dissolved in toluene (380 mL) and stirred at 70 °C for 15 h. The reaction mixture was cooled to RT, evaporated to dryness, re-dissolved in EtOAc and washed with 0.1M HCl and brine. The organic solution was dried over anhydrous MgSO₄, evaporated to

dryness and purified by flash column chromatography, using 5% to 10% EtOAc in hexane as the eluent, to obtain the Boc-protected aniline (23 g). The Boc-protected bromoaniline (10.7 g, 39.2 mmol) was dissolved in anhydrous THF (75 mL) in a flask equipped with an overhead stirrer. The solution was cooled to 0 °C and MeLi (1.2 M in Et₂O, 33 mL, 39.2 mmol) was added drop wise while maintaining the internal temperature below 7 °C. The reaction mixture was stirred at 0 °C for 15 min and then cooled to -78 °C before n-BuLi (2.4 M in hexane, 17 mL, 39.2 mmol) was added drop wise, maintaining the internal temperature below -70 °C). The reaction mixture was stirred at -78 °C for 1h, B(OEt)₃ (17 mL, 98 mmol) was added drop wise (internal temperature < -65 °C) and stirring was continued for 45 min at -78 °C and at 0 °C for 1 h. The reaction mixture was then treated with 5% aqueous HCl (~100 mL, to pH ~1) for 15 min and NaCl(s) was added to saturate the aqueous layer. The aqueous layer was extracted with 0.5 M NaOH (4 x 100 mL) and the combined aqueous layers were acidified with 5% HCl (150 mL, to pH ~1) and extracted with Et₂O (3 x 200 mL). The combined organic layers were dried over anhydrous MgSO₄, filtered and concentrated to give the N-Boc carbamate of 4-aminophenylboronic acid as a solid (7.5 g).

Thiourea (7.60 g, 100 mmol) and ethyl bromopyruvate (12.6 mL, 100 mmol) were mixed and heated to 100 °C for 45 min. After cooling of the reaction mixture, the solid obtained was triturated with acetone, filtered and recrystallized from EtOH to obtain the desired aminothiazole product (10.6 g, 40 mmol). The aminothiazole was then added slowly (over a period of 20 min) to a solution of t-butyl nitrite (6.2 g, 60 mmol) and CuBr₂ (10.7 g, 48 mmol) in MeCN (160 mL) at 0 °C. The reaction mixture was allowed to warm-up to RT and to stirred for 2.5 h. The mixture was then added to an aqueous HCl solution (20%) and extracted with Et₂O (2 x 400 mL). The organic layer was washed with aqueous HCl (10%), dried over anhydrous MgSO₄ and evaporated to dryness. The desired bromothiazole product was isolated in ~85% yield (4.3 g) after flash column chromatography using 15% EtOAc in hexane as the eluent.

The reaction mixture was then cooled to RT, diluted with EtOAc and extracted with brine, aqueous NaHCO₃ (2 x) and brine. The organic layer was dried over anhydrous

MgSO₄ and concentrated to dryness. The carbamate-ester product was isolated after flash column chromatography using 20% to 30% EtOAc in hexane: 180 mg. The aniline hydrochloride of example 26 was isolated after removal of the Boc protecting group with 4N HCl in dioxane for 30 min.

EXAMPLE 27**Ethyl 5-amino-1-methyl-1H-indole-2-carboxylate:**

- 10 The ethyl ester of 5-nitroindole-2-carboxylic acid (0.300 g, 1.28 mmol) was dissolved in anhydrous DMF (6 mL) and NaH (0.078 g, 60%, 1.92 mmol) was added. The reaction was stirred at RT for 20 min, then Mel (160 μ L, 2.56 mmol) was added and stirring was continued for 3 h. The reaction was quenched with the addition of aqueous NaHCO₃ (~1%) while stirring vigorously. The brown solid formed (0.096 g) was filtered and dried in air overnight.
- 15 The N-methyl nitro derivative (196 mg, 0.79 mmol) was then dissolved in DMF (4 mL), H₂O (400 μ L) and SnCl₂·2H₂O (888 mg, 3.95 mmol) were added, and the mixture was stirred at 60 °C for 3 h. The mixture was then partitioned between 10% aqueous NaHCO₃ and EtOAc and stirred vigorously. The aqueous layer was re-extracted with EtOAc and the combined EtOAc layers were washed with brine, dried
- 20 over anhydrous MgSO₄ and concentrated to dryness. The residue was purified by flash column chromatography, using 1:1 ratio EtOAc/hexane as the eluent, to obtain the pure 5-aminoindole derivative (118 mg) of example 27.

EXAMPLE 28

- 25 **Ethyl 5-[[1-(4-amino-1-ethyl-piperidin-4-yl)-methanoyl]-amino]-1-methyl-1H-indole-2-carboxylate:**

The 5-aminoindole derivative of example 27 was coupled to N-Fmoc-amino-(4-N-Boc-piperidinyl)carboxylic acid. The Boc protecting group was removed with 25% TFA in CH_2Cl_2 in the usual way, and the product was then dissolved in EtOH (6 mL).

5 AcOH (133 mg), acetaldehyde (33 mg, 0.74 mmol) and NaCNBH_3 (23mg, 0.37 mmol) were added and the reaction mixture was stirred at room temperature for 2 h.

The reaction mixture was concentrated to remove most of the solvent, the residue was re-dissolved in EtOAc and washed with saturated NaHCO_3 and brine. The organic layer was dried over anhydrous MgSO_4 and concentrated to give the N-ethyl derivative as an orange solid.

10 This solid was dissolved in THF (2.5 mL), DBU (113 mg, 0.74 mmol) was added and the mixture was stirred at room temperature for 30 min. The solvent was evaporated, the remaining residue was dissolved in EtOAc and the organic layer was washed with saturated NaHCO_3 and brine. The organic layer was further extracted with 1N HCl and H_2O (2 x), and the pH of the combined aqueous layers was adjusted to pH ~10 with 1N NaOH. The aqueous layer was then extracted with EtOAc (3 x), the combined organic layers were washed with brine, dried over anhydrous MgSO_4 and concentrated to dryness to give the title amine derivative of example 28 (44 mg): MS (ES^+) m/z 373.1 (MH^+).

20 A similar reductive amination procedure was used to prepare other N-alkylated pyrrolidine (e.g. cucurbitine) and piperidine derivatives. Alternatively, the reductive amination can be performed as the last step on a fully assembled inhibitor.

EXAMPLE 29

25 **General procedure for coupling amines to 6-indole carboxylic acids to give amide derivatives of general formulae I:**

Indole carboxylic acids were coupled to various amines (for example according to

the examples 15a, 15b, 15c, 19, 20, 21, 22, 23, 24, 25, 28, 34, 35, 36, 42, 43, or 45) using standard amide bond forming procedures familiar to those skilled in the art. Amide bond forming reagents include but are not limited to carbodiimides (DCC, EDC), TBTU, HBTU, HATU and BOP-Cl in the presence or absence of additives such as HOBT or HOAT. Indole carboxylic acids can also be activated for coupling by conversion to the corresponding acid chloride, symmetrical anhydride or unsymmetrical anhydrides using standard protocols familiar to those skilled in the art of organic chemistry. The coupling of indole carboxylic acids with amines is generally carried out in solvents such as THF, DCM, DMF, DMSO or MeCN, in the presence of a tertiary organic base including, but not limited to triethylamine, *N*-methylmorpholine, collidine and diisopropylethylamine. Following coupling of the indole carboxylic acid with the amine, any remaining protecting group that remains in the molecule can then be removed using the appropriate procedure. The following example serves to illustrate such a process and is non-limiting.

(E)-3-[4-({1-[1-({1-[3-Cyclohexyl-2-furan-3-yl-1-(2-morpholin-4-yl-2-oxo-ethyl)-1H-indole-6-yl]-methanoyl)-amino)-cyclobutyl]-methanoyl)-amino)-phenyl]-acrylic acid:

The indole carboxylic acid of example 9 (0.030 g, 0.069 mmol, 1 equiv.), the amine of example 21 (0.044 g, 0.153 mmol, 2.2 equiv.) and TBTU (0.076 g, 0.24 mmol, 3.4 equiv.) were dissolved in DMSO (2 mL) and triethylamine (84 μ L, 0.6 mmol, 8.7 equiv.) was added. The mixture was stirred overnight at room temperature (complete by HPLC). 3N NaOH (0.7 mL) was added and the mixture stirred at 50 $^{\circ}$ C for 40 min (complete hydrolysis by HPLC). Acetic acid was added to neutralize the reaction mixture and the product was isolated directly by preparative HPLC as a beige amorphous solid (19 mg).

EXAMPLE 30

General procedure for the preparation of indole 6-acylsulfonamide derivatives:

Indole carboxylic acids were converted to the corresponding acid chloride and

coupled to various sulfonamides in the presence of DMAP and an organic base such as triethylamine, DIEA, *N*-methylmorpholine and the like. Alternatively, the carboxylic acid was activated using amide bond forming agents such as carbodiimides (DCC, EDC), TBTU, HATU and the like and treated with sulfonamides in the presence of DMAP. Sulfonamides were either from commercial sources or prepared from the corresponding sulfonyl chlorides and a solution of ammonia in dioxane.

The following example serves to illustrate such a process and is non-limiting.

4-Bromo-*N*-{1-[3-cyclohexyl-2-furan-3-yl-1-(2-morpholin-4-yl-2-oxo-ethyl)-1*H*-indole-6-yl]-methanoyl}-benzenesulfonamide:

3-Cyclohexyl-2-furan-3-yl-1-(2-morpholin-4-yl-2-oxo-ethyl)-1*H*-indole-6-carbonyl chloride:

The carboxylic acid of example 9 (0.800 g, 1.833 mmol, 1 equiv.) was suspended in DCM (15 mL) and DMF (20 μ L) was added followed by oxalyl chloride (323 μ L, 3.7 mmol, 2 equiv.). After stirring for 2 h at room temperature, volatiles were removed under reduced pressure and the residue co-evaporated twice with DCM. After drying under vacuum for 1.5 h, the acid chloride was obtained as a brown solid that was used directly in the next step.

4-Bromo-*N*-{1-[3-cyclohexyl-2-furan-3-yl-1-(2-morpholin-4-yl-2-oxo-ethyl)-1*H*-indole-6-yl]-methanoyl}-benzenesulfonamide:

The acid chloride from above (0.032 g, 0.07 mmol, 1 equiv.) was dissolved in DCM (2 mL) and 4-bromobenzenesulfonylamine (0.0205 g, 0.085 mmol, 1.2 equiv.) was added. Triethylamine (21 μ L, 0.15 mmol, 2.16 equiv.) and DMAP (0.018 g, 0.147

mmol, 2.1 equiv.) were added and the mixture was stirred overnight at room temperature (complete by HPLC). DCM was then evaporated in air and the residue re-dissolved in DMSO (2 mL). The title compound of example 30 was isolated directly by preparative HPLC as a light yellow powder (27 mg).

EXAMPLE 32

- 15 **3-Cyclohexyl-2-furan-3-yl-1-(2-morpholin-4-yl-2-oxo-ethyl)-1H-indole-6-carboxylic acid acetyl-amide:**

- Acetamide (9 mg, 0.152 mmol, 1.38 equiv.) was dissolved in THF (2 mL) and NaH (60 % oil dispersion, 8 mg, 0.2 mmol, 1.81 equiv.) was added. The mixture was stirred for 30 min and the acid chloride of example 30 (0.050 g, 0.11 mmol, 1 equiv.) in THF (1 mL) was added. The reaction mixture was then stirred for 2 h at room temperature (complete by TLC). The reaction was diluted with EtOAc and the solution washed with 10 % aqueous HCl and dried (Na₂SO₄). After evaporation of the solvent under reduced pressure, the residue was purified by flash chromatography on silica gel using EtOAc as eluent. This compound is a starting material for the synthesis of compounds according to the general formula I.4, whereby the methods as described hereinbefore, e.g. 4 to 8 and/or in combination with 9 to 32, can be employed in an analogous manner.

10

EXAMPLE 34***2-(1-Amino-cyclobutyl)-3-methyl-benzofuran-5-carboxylic acid methyl ester***

- 15 Methyl 4-hydroxybenzoate (20.00 g, 131 mmol) was dissolved in DMF (350 mL) and K_2CO_3 (24.19 g, 175 mmol) was added. The mixture was stirred for 30 min and crotyl bromide (85%, 16.47 mL, 160 mmol) was added dropwise over 4 min. The resulting amber suspension was stirred for 4 h at room temperature. It was then poured into DCM and the solution washed with water and brine. The extract was
- 20 dried ($MgSO_4$) and evaporated to a pale yellow oil consisting of a mixture of two isomeric allyl ether (4:1 ratio). Upon standing at room temperature, the oil partially crystallized. The supernatant was decanted and the crystals washed with hexane to

provide 12.5 g of the desired ether as white crystals.

The above material (10.30 g, 50mmol) was added to a flask heated to 230 °C in a sand bath and the melted oil was stirred for 25 min at that temperature. The material was then brought back to room temperature and the resulting waxy solid used

5 without purification in the next step.

The rearranged phenol from above (10.00 g, 48.5 mmol) was dissolved in MeOH and the solution cooled to -78 °C in a dry ice – acetone bath. Ozone was bubbled through the solution until complete disappearance of starting material (TLC).

Dimethyl sulfide (7 mL) was then added dropwise at -78 °C and the mixture stirred
10 for 10 min at -78 °C and at room temperature for 30 min. Volatiles were removed under reduced pressure, the residue was dissolved in ether and the solution washed with water (2 X) and brine. After drying (MgSO₄) and removal of volatiles, the crude product which consists of a mixture of aldehyde and lactol was obtained as a milky oil (9.9 g).

15 The crude product from above (9.9 g, 48 mmol) was suspended in 85% phosphoric acid (40 mL) and heated to 50 °C for 50 min after which a white solid precipitated. Water (50 mL) was added and the solid collected by filtration. The material was then dissolved in EtOAc and washed with saturated aqueous NaHCO₃ and water. The solution was dried (MgSO₄) and concentrated to yield a residue that was purified by
20 flash chromatography on silica gel using 10% EtOAc – hexanes as eluent. The desired benzofuran derivative was obtained (2.39 g).

The benzofuran derivative from above (2.20 g, 11.6 mmol) was dissolved in THF (65 mL) and the solution cooled to -78 °C. A solution of lithium diisopropylamide (LDA, 2M in heptane/THF/ethylbenzene, 6.9 mL) was added dropwise over 10 min. After
25 stirring for 35 min, cyclobutanone (1.793 mL, 24 mmol) was added dropwise and stirring continued at -78 °C for 15 min. The reaction mixture was then warmed to room temperature and quenched with 1N HCl. The product was extracted with EtOAc, washed with water and brine and dried (Na₂SO₄). Purification by flash chromatography on silica gel using 25% EtOAc in hexanes gave the desired
30 cyclobutyl carbinol (1.39 g) as a clear gum.

The alcohol from above (1.38 g, 5.3 mmol) and sodium azide (1.105 g, 17 mmol) were suspended in CHCl₃ (30 mL) and the mixture cooled in ice. TFA (1.695 mL, 22 mmol) was added dropwise over 10 min, the cooling bath was removed and the mixture stirred at room temperature for 20 min. The reaction mixture was diluted
35 with CHCl₃, washed with saturated aqueous NaHCO₃ and dried (MgSO₄). Removal

of solvents under reduced pressure gave a amber oil that was purified by flash chromatography on silica gel using 5% EtOAc in hexane as eluent. The desired azide was obtained as a clear oil (882 mg).

The azide from above (880 mg) was hydrogenated (1 atm H₂) in MeOH over 5%

- 5 Lindlar catalyst (374 mg). After 15 min, the reduction was judged complete by TLC. Removal of the catalyst by filtration and solvent under reduced pressure gave the desired amine derivative of example 34 (785 mg) as a colorless oil: ES-MS: *m/z* 243 (M-NH₂).

10 EXAMPLE 35

3-[2-(1-Amino-cyclobutyl)-1-(toluene-4-sulfonyl)-1H-indol-6-yl]-acrylic acid ethyl ester

- 15 Indole 6-carboxylic acid (10.00 g, 62 mmol) was esterified by refluxing overnight in a mixture of MeOH (200 mL) and conc. H₂SO₄ (1 mL). After cooling, the reaction mixture was poured into sat. aqueous NaHCO₃ and extracted with EtOAc. The extract was washed with aqueous NaHCO₃ twice and water. Drying (MgSO₄) and removal of volatiles gave the desired methyl ester as a brown oil (10.4 g).
- 20 The ester from above (10.40 g, 62 mmol) was dissolved in DMF (80 mL) and the solution cooled in ice. Sodium Hydride (60% oil dispersion, 2.852 g, 71.3 mmol) was added in small portions and the mixture was stirred at room temperature for 40 min. The reaction mixture was brought back to 0 °C and para-toluenesulfonyl chloride (14.49 g, 76 mmol) was added. The mixture was stirred for 2 h at room temperature.
- 25 The reaction mixture was then diluted with EtOAc, washed consecutively with 10% citric acid (2 X), NaHCO₃ (2 X) and brine. After drying (MgSO₄), removal of solvent gave a beige residue that was triturated twice with ether – hexanes (7.7 g). Concentration of mother liquors and trituration of the residue with MeOH gave an

additional 5.8 g of the desired tosylated indole.

The material from above (1.750 g, 5.31 mmol) was dissolved in DCM (40 mL) and the solution cooled to -78 °C. Diisobutylaluminum hydride (1M in DCM, 12.72 mL, 12.72 mmol) was added dropwise and the mixture stirred for 30 min at -78 °C. The reaction mixture was then warmed to room temperature, quenched with aqueous potassium sodium tartrate and stirred overnight at room temperature. The organic phase was decanted, washed with brine and dried (MgSO₄). Removal of volatiles and purification by flash chromatography on silica gel gave the desired alcohol as a colorless oil (1.35 g).

5 The alcohol from above (1.250 g, 4.15 mmol) was dissolved in THF (150 mL) and the solution was cooled to -78 °C. Lithium diisopropylamide (2M in THF/heptane/ethyl benzene, 10.37 mL) was added dropwise over 5 min. After stirring for an additional 30 min at -78 °C, cyclobutanone (1.55 mL, 20.7 mmol) was added and the reaction mixture allowed to warm up to 0 °C. The reaction was quenched with 10% citric acid and THF removed under reduced pressure. Water was added and the product was extracted with EtOAc, washed with aqueous NaHCO₃ and brine, and dried (MgSO₄). The material was purified by flash chromatography on silica gel using 30-50% EtOAc in hexanes as eluent. The desired cyclobutyl carbinol was obtained as an oil (0.94 g).

20 The alcohol from above (0.870 g, 2.34 mmol) was dissolved in DCM (20 mL) and 1,1,1-tris(acetyloxy-1,1-dihydro-1,2-benzodioxol-3-(1H)-one (Dess-Martin periodinane) (1.060 g, 2.50mmol) was added. The mixture was stirred at room temperature for 3 h, quenched with aqueous NaHCO₃ and extracted with EtOAc. The extract was washed with brine, dried (MgSO₄) and concentrated to give the desired aldehyde as an oil that was used directly in the next step.

25 The crude aldehyde (assume 2.34 mmol) from above was dissolved in DCM (20 mL) and (carbethoxymethylene)triphenylphosphorane (0.871 g, 2.5 mmol) was added. The mixture was refluxed for 4 h, concentrated and the product isolated by flash chromatography on silica gel using 20-30% EtOAc in hexanes as eluent. The desired cinnamate was obtained as a foam (0.400 g).

30 The cinnamate derivative from above (0.400 g, 0.9 mmol) was dissolved in CHCl₃ (15 mL) and sodium azide (138 mg, 2.1 mmol) was added. TFA (0.39 mL, 5.1 mmol) was added dropwise over 5 min and the mixture was then stirred at 60 °C for 4 h. The reaction mixture was diluted with CHCl₃, washed with aqueous NaHCO₃ and dried (MgSO₄). The product was purified by flash chromatography on silica gel using

35

20% EtOAc in hexane as eluent, to give the desired azide as a yellow foam (0.207 g).

The azide from above (0.183 g) was dissolved in THF (5 mL) containing 1% water and triphenylphosphine (180 mg) was added. The mixture was stirred at 60 °C for 20 h and the final product of example 35 isolated by preparative reversed-phase HPLC (42 mg).

This amine was coupled in the usual manner to indole carboxylic acid derivative to give final inhibitors after cleavage of the N-tosyl and ester protecting groups with NaOH.

Final products obtained as above were also methylated on the indole nitrogen by treating the fully deprotected molecules with NaH and iodomethane, followed by saponification of the methyl ester which was formed concomitantly.

EXAMPLE 36

3-(4-Amino-2-ethoxy-phenyl)-acrylic acid methyl-ester

2-Ethoxy-4-nitrobenzoic acid (1.56 g; 7.38 mmol) was dissolved in methanol (15 mL) and the resulting solution stirred at 0°C. A solution of diazomethane in ethyl ether was slowly added until the yellow color persisted and was stirred for a further 20 min.

The solvents were evaporated to afford the methyl ester as a pale yellow solid (1.66 g, quant.) which was used without further purification.

The ester from above (1.60 g; 7.10 mmol) was dissolved in dry toluene and the solution cooled to -78 °C under a nitrogen atmosphere. A solution of diisobutylaluminum hydride in tetrahydrofuran (1M; 8 mL; 8 mmol) was added and the reaction allowed to warm to ambient temperature. Two additional portions of DIBAL-H were added in this way (7 and 10 mL) after 1 h and a further 1.5 h. 0.5 h after the last addition, the reaction was cooled to 0°C and 1N HCl (25 mL) was slowly added and the mixture stirred vigorously for 0.5 h. The organic solvents were then evaporated and the aqueous residue was extracted with ethyl acetate (2 x 50 mL)

and washed with water (50 mL) and brine (50 mL). The combined extracts were then dried over MgSO_4 and evaporated to afford the alcohol as a pale yellow, fibrous solid (1.40 g; quant.) which was used as such.

- 5 A turbid solution of 1,1,1-tris(acetyloxy-1,1-dihydro-1,2-benzodioxol-3-(1H)-one (Dess-Martin periodinane) (2.32 g; 5.47 mmol) in dichloromethane (40 mL + 5 mL rinse) was added to a stirred solution of the above alcohol (0.98 g; 4.97 mmol) in DCM (40 mL) and the reaction stirred at ambient temperature under a nitrogen atmosphere. After 4 h, saturated NaHCO_3 / 10 % $\text{Na}_2\text{S}_2\text{O}_3$ (1:1, 160 mL) was added and the mixture stirred vigorously until the phases were clear (ca. 0.5 h). The
- 10 organic phase was separated and the aqueous phase was extracted with dichloromethane (50 mL) and washed with saturated NaHCO_3 (2 x 150 mL). The combined organic phases were then dried over MgSO_4 and evaporated to yield the aldehyde as a pale yellow solid (960 mg; 99 %) which was used as such.
- Sodium hydride (95% dry powder; 158 mg; 6.25 mmol) was suspended in anhydrous
- 15 THF (10 mL) and trimethyl phosphonoacetate (0.945 mL; 5.84 mmol) added dropwise at 0°C under a nitrogen atmosphere resulting in a solid white mass which could not be stirred. A solution of the aldehyde from above (950 mg; 4.87 mmol) in THF (7 mL + 3 mL rinse) was then added dropwise resulting in a yellow colour and slow dissolution of the white solid mass. After the addition, the reaction was allowed
- 20 to warm to ambient temperature. After 15 h, the cloudy reaction mixture was evaporated to a pale yellow solid which was extracted with ethyl acetate (2 x 50 mL) and washed with saturated NaHCO_3 (3 x 75 mL). The combined extracts were dried over MgSO_4 and evaporated to afford the cinnamate ester as pale yellow solid (1.212 g; 99 %) which was used without further purification.
- 25 The nitro cinnamate from above (0.300 g, 1.2 mmol) was suspended in EtOH (12 mL) and water (7.5 mL) and K_2CO_3 (0.990 g, 7.16 mmol) and 85% sodium hydrosulfite (1.247 g, 7.16 mmol) were added successively. The mixture was stirred vigorously at room temperature for 1.5 h. It was then diluted with water (10 mL) and the ethanol removed under reduced pressure. The reaction mixture was extracted
- 30 with EtOAc (2 x), washed with water and brine and dried (MgSO_4). Removal of the solvent under reduced pressure gave the desired aniline as a yellow solid.
- Note: the analogous methoxy derivative was prepared in the same manner using commercially available 2-methoxy-4-nitrobenzoic acid as starting material.

EXAMPLE 37**3-(4,5-Diamino-2-alkoxy-phenyl)-acrylic acid methyl esters**

The procedures will be illustrated for R = Et but similar protocols can be used to
 5 prepare derivatives with other alkoxy substituents.

The ortho-ethoxy-para-nitro cinnamate derivative prepared as described in example
 36 (600 mg; 2.39 mmol) was dissolved in concentrated sulphuric acid (5.5 mL) at
 0°C and potassium nitrate (253 mg; 2.50 mmol) added in portions over 3 min. After
 5 min, the resulting yellow-brown solution was allowed to warm to ambient

10 temperature and was stirred under a nitrogen atmosphere. After 3 h, the reaction
 was added to ice (75 g) resulting in a pale yellow precipitate. Once the ice had
 melted, the suspension was sonicated, filtered and washed several times with
 distilled water. Air drying overnight afforded the dinitrocinnamate as a pale yellow,
 chalky solid (661 mg; 93 %) which was used without further purification.

15 The dinitrocinnamate (657 mg; 2.22 mmol) was dissolved/suspended in ethanol /
 water (1:1; 40 mL) resulting in a yellow suspension which was stirred vigorously at
 ambient temperature. Potassium carbonate (3.06 g; 22.2 mmol) and sodium
 hydrosulfite (3.86 g; 22.2 mmol) were successively added resulting immediately in a
 dark violet/green colour which quickly began to lighten to a pale orange. After 3 h,
 20 the reaction was diluted with water (20 mL) and the ethanol evaporated. The
 aqueous residue was extracted with ethyl acetate (2 x 50 mL) and washed with
 saturated NaHCO₃ (2 x 60 mL) and brine (30 mL). The combined extracts were
 dried over Na₂SO₄ and evaporated to afford the dianiline as a dark orange syrup
 which solidified under high vacuum (377 mg; 72 %).

25 Such dianiline derivatives as described in this example could be converted to
 benzimidazole derivatives by coupling to amino acid derivatives as described in
 example 22 to prepare inhibitors.

EXAMPLE 38

30 **3-(4-Amino-2-alkyl-phenyl)-acrylic acid methyl esters and 3-(4,5-diamino-2-
 alkyl-phenyl)-acrylic acid methyl esters**

- As one skilled in the art would recognize, analogs of derivatives presented in examples 36 and 37 where the alkoxy group has been replaced by an alkyl, alkenyl or alkynyl substituent (e.g. R = Me, Et, Pr, vinyl, allyl) can be prepared by converting such an alkoxy derivative (e.g. methoxy) to the corresponding phenol by cleaving the ether linkage with reagents such as BBr₃ and then converting the phenol substituent to the corresponding triflate. Such triflates can then be used as substrates in a variety of transition metal catalyzed cross-coupling reactions with organometallic reagents that would allow replacement of the triflate functionality by an alkyl substituent. Such reagents might include tetraalkyltin, tetraalkenyltin, alkylboronic acid and alkenylboronic acid derivatives that would undergo cross-coupling under Pd⁰ catalysis. In some cases (e.g. allyl or vinyl), the substituent can be further elaborated (e.g. the double bond can be converted to a cyclopropane ring using a cyclopropanating reagent known to people skilled in the art)
- Once the alkyl group has been introduced, the intermediates can then be elaborated to inhibitors following synthetic sequences described in previous examples.

EXAMPLE 39

1-Carboxymethyl-3-cyclohexyl-2-furan-3-yl-7-methyl-1H-indole-6-carboxylic acid methyl ester

Step 1: 3-amino-4-methylbenzoic acid (15.00 g, 0.099 mol) was suspended in MeOH (150 mL) and thionyl chloride (25.33 mL, 0.347 mol, 3.5 equiv.) was added dropwise. The mixture was heated overnight at 70 °C. After cooling to RT, volatiles were removed under reduced pressure and the residue triturated with ether (150 mL). The solid was filtered off and dried (18.36 g). The solid was suspended in DCM (600 mL) and saturated aqueous NaHCO₃ (250 mL) was added. After stirring for 15 minutes, the organic layer was separated and washed successively with NaHCO₃ solution (2 x 250 mL), water (250 mL) and brine (250 mL). The solution was dried (Na₂SO₄), filtered and evaporated to dryness to give the desired aniline (14.8 g, 90% yield).

Steps 2 and 3: the ester from above (12.50 g, 75.6 mmol) was dissolved in DCM (190 mL) and methylthioaldehyde dimethyl acetal (10.1 mL, 75.6 mmol) was added. The solution was cooled to -30 °C. N-chlorosuccinimide (10.10 g, 75.6 mmol) was added in 6 portions over 30 minutes. Triethylamine (10.6 mL, 75.6 mmol) was then added dropwise over 10 min and after stirring for an additional 15 min, the cooling bath was removed and the temperature brought to reflux. After 5 h, the reaction mixture was cooled to RT and evaporated to dryness. The residue was dissolved in

ether (750 mL) and 2M HCl (303 mL) was added. After stirring at RT for 1.5 h, the ether layer was separated and washed with NaHCO₃ solution (2 x 150 mL) and brine (250 mL). The original acidic aqueous phase was extracted with DCM (2 x 100 mL) and the extracts washed as above and then combined with the first ether phase.

- 5 The combined organic phases were dried (Na₂SO₄) and evaporated to dryness and the material purified by flash chromatography on silica gel using 30-0% hexane in DCM as eluent to give the desired 3-thiomethylindole derivative (9.37 g).

Step 4: the thiomethyl indole from above (8.37 g, 35.4 mmol) was dissolved in absolute EtOH (220 mL) and Raney-nickel (Ra-Ni) (25 g) was added. After stirring
10 at RT for 3 h, another portion of Ra-Ni (15 g) was added and stirring resumed for an additional 45 min. The mixture was filtered and the filtrate evaporated to dryness to give the desired indole (6.26 g, 93%).

Steps 5: the indole ester from above (4.00 g, 21 mmol) was dissolved in a mixture of MeOH (18 mL) and water (18 mL). KOH (11.86 g, 210 mmol) was added and the
15 mixture stirred at 75 °C for 2 h. Cyclohexanone (7.26 g, 74 mmol, 3 equiv.) was added dropwise over 15 min and stirring at 75 °C was continued overnight. MeOH was removed under reduced pressure and water (500 mL) was added to the residue. Insoluble material was removed by filtration and the aqueous phase was then washed with TBME (200 mL). The aqueous phase was acidified to pH 4 with formic acid to produce a white precipitate that was collected by filtration, washed with water and dried. The desired cyclohexenylindole was obtained (4.77 g, 89%).

Steps 6-8: as described in example 2.

Steps 9-11: as described in examples 4 and 6.

25 EXAMPLE 40

1-Carboxymethyl-3-cyclohexyl-2-furan-3-yl-5-methoxy-1H-indole-6-carboxylic acid methyl ester

Step 1: 4-methylsalicylic acid (100 g, 0.66 mol) was dissolved in acetone (1 L) and

- K₂CO₃ (227 g, 1.64 mol, 2.5 equiv.) was added in portions. The mixture was heated to reflux and dimethylsulfate (155 mL, 1.64 mol, 2.5 equiv.) was added dropwise over 1 h. The mixture was refluxed overnight. Additional K₂CO₃ (90 g) and dimethylsulfate (60 mL) were added and the mixture refluxed for an additional 20 h.
- 5 K₂CO₃ (20 g) and dimethylsulfate (15 mL) were again added and after refluxing for 7 h, the reaction was judged complete by TLC. Solids were removed by filtration using acetone for washings and the filtrate concentrated to a volume of 200 mL. The solution was diluted with MeOH (1 L) and stirred with ammonium hydroxide (300 mL) for 30 min. MeOH was removed under reduced pressure and the residue extracted
- 10 with EtOAc (2 x 400 mL). The extract was washed with brine (500 mL) and dried (Na₂SO₄). Removal of volatiles gave the desired product as a yellow oil (119 g).
- Step 2: the ester from above (117 g, 0.649 mol) was charged in a flask cooled in ice. The ester was dissolved in conc. H₂SO₄ (600 mL) and the solution cooled to -3 °C. Conc. HNO₃ (51 mL) was added dropwise over 1.5 h keeping the internal
- 15 temperature around 0 °C. The ice bath was removed and the mixture stirred at RT for 3.5 h. The reaction mixture was poured over ice and allowed to stand overnight. The precipitated solid was collected by filtration, washed with water and dried. The material was purified by trituration from hot methanol and flash chromatography on silica gel to separate the desired product from a dinitro side product.
- 20 Step 3: The nitro ester from above (75.7 g, 0.336 mol) was dissolved in DMF (322 mL) and DMF dimethylacetal (120.1 g, 1.01 mol) was added dropwise over 10 min. The mixture was heated to 115 °C for 3h (complete by TLC). The reaction mixture was cooled to RT and volatiles removed under vacuum. The residue was co-evaporated twice with DCM and triturated with ether to give a total of 90.02 g (95%
- 25 yield) of the desired enamine derivative.
- Step 4: The enamine from step 3 (90.02 g, 0.321 mol) was dissolved in 1:1 THF-MeOH (1.48 L) and the mixture heated to 35 °C in a water bath. Raney nickel (washed with THF, 6.3 g) was added followed by dropwise addition of hydrazine (18.5 g, 0.369 mol) over 15 min. After stirring for 1h (internal temperature: 49 °C), a
- 30 second portion of hydrazine (18.5 g) was added dropwise and the mixture stirred overnight at 49 °C. Evaporated solvent was replenished and Raney-nickel (6.3 g) and hydrazine (18.5 g) were again added followed by another portion of hydrazine (18.5 g) after stirring for an additional 3 h. After stirring at 54 °C overnight, the reaction was completed by addition of a last portion of Raney-nickel (6.3 g) and
- 35 hydrazine (36 mL) and stirring 20 h. The reaction mixture was then brought back to

RT and filtered using DCM for washings. The filtrate was evaporated to dryness under reduced pressure and the residue purified by flash chromatography on silica gel using 2-30% EtOAc in DCM as eluent. The desired indole was obtained (41.1 g). The indole from step 4 was elaborated to the title compound of example 40 using procedures similar to those described in the previous example.

EXAMPLE 41***3-Cyclohexyl-2-furan-3-yl-5-hydroxy-1-[2-oxo-2-(4-pyrrolidin-1-yl-piperidin-1-yl)-ethyl]-1H-indole-6-carboxylic acid***

This is a representative procedure that can be applied to analogs with other amide substituents: the methoxyindole (30 mg) was dissolved in DCM (1 mL) and the solution was cooled in ice under a nitrogen atmosphere. Boron tribromide (1M in DCM, 0.3 mL) was added dropwise and the mixture was stirred for 40 min at 0 °C and then 30 min at RT. The reaction was then quenched by addition of ice, diluted with DCM and neutralized by addition of solid NaHCO₃. The organic phase was separated and dried (MgSO₄). Evaporation of the solvent under reduced pressure gave the desired phenol derivative as a yellow solid (21 mg) that was saponified to give the title compound of example 41 under standard conditions. Alternatively, the intermediate phenolic ester can be alkylated under standard conditions (e.g. NaH in DMF) to produce various ether derivatives (e.g. with tert-butyl bromoacetate)

EXAMPLE 42***1-(2-Methyl-thiazol-4-yl)-cyclobutylamine hydrochloride***

Step 1: The starting protected amino acid was obtained using a similar procedure to that described in example 21 but using benzyl alcohol instead of trimethylsilyl ethanol in the Curtius rearrangement. The acid (7.48 g, 30 mmol) was dissolved in THF (50 mL) and the solution cooled to -8 °C under a nitrogen atmosphere. N-Methylmorpholine (3.63 mL, 33 mmol) was added dropwise followed by isobutylchloroformate (3.89 mL, 30 mmol). The suspension was stirred for 10 min and filtered under nitrogen, keeping the filtrate at -8 °C. The solution was then added to an excess ethereal diazomethane solution and the mixture stirred for 30 min (TLC shows complete conversion to the diazomethylketone). 48% HBr in water (3.50 mL, 31 mmol) was then added dropwise over 5 min to the cold solution. A second portion of HBr (3.5 mL) was added after 5 min, the cooling bath was removed and the mixture stirred at RT overnight. Ether (250 mL) was added and the solution washed with water (2 x 50 mL), saturated NaHCO₃ (50 mL) and brine (50 mL). After drying (MgSO₄), volatiles were removed under reduced pressure and the residue triturated with 1:4 ether / hexanes. The white solid was filtered, washed with hexane and dried in vacuum. The desired bromomethylketone (7.35 g, 75% yield) was obtained as a white solid.

Step 2: The bromomethylketone from above (228 mg, 0.7 mmol) and thioacetamide (56.3 mg, 0.75 mmol) were heated to reflux in isopropanol (5 mL). After 1 h, the reaction mixture was evaporated to dryness and the oily residue triturated with water to give a white precipitate that was collected, washed with water and dried in vacuum (185 mg, 87% yield).

Step 3: 10% Pd on charcoal (70 mg) was suspended in EtOH (5 mL) and the protected thiazole derivative from above (180 mg) was added. Hydrochloric acid was added to acidify the reaction mixture which was then stirred under 1 atm of H₂ gas for 20 h. The catalyst was removed by filtration and the filtrate evaporated to dryness under reduced pressure to give the desired amine hydrochloride as a white solid (104 mg) after trituration with ether.

The amine hydrochloride was coupled to indole derivatives under standard conditions.

- Note: Analogous thiazole derivatives can be prepared in a similar way by using differently substituted thioamide, thiourea or acylthiourea derivatives. In addition, other protected amino acids can be used as starting materials in this sequence and converted to their respective bromo or chloromethylketones to be used in turn to prepare various substituted thiazole derivatives.

EXAMPLE 43

- 10 **(Z)-3-[2-(1-Amino-cyclobutyl)-6-ethoxy-1-methyl-1H-benzimidazol-5-yl]-acrylic acid methyl ester**

- The 4-nitro-2-ethoxycinnamate (303 mg, 1.206 mmol), prepared as described in example 36 was dissolved in concentrated sulfuric acid (3 mL) and the solution cooled to 0 °C. Potassium nitrate (128 mg, 1.27 mmol) was added and the mixture stirred for 3.5 h at room temperature. After completion, the reaction mixture was poured over ice and the precipitated solid was collected by filtration. The crude product was washed with water, dried under vacuum and used without purification in the next step (390 mg).
- 15 The dinitro derivative from above (390 mg) was dissolved in THF (3 mL) and methylamine in THF (3.02 mL of a 2M solution in THF) was added. After stirring for 30 min, volatiles were removed under reduced pressure and the orange solid used as such in the next step.
- 20 The nitro arene from above was suspended in a mixture of EtOH (12 mL) and water (12 mL) and K₂CO₃ (1.00 g, 6 equivalents) was added followed by sodium hydrosulfite (1.26 g, 6 equivalents). The mixture was stirred for 4 h at room temperature and EtOH was removed under reduced pressure. The residue was extracted with EtOAc and the organic phase washed with brine and dried (MgSO₄). Removal of the solvent and purification of the residue by flash chromatography (50 to 75% EtOAc in hexane) gave the desired diamine (162 mg).
- 25 30

The dianiline from above (162 mg) was dissolved in acetonitrile (6 mL) and aminocyclobutanecarboxyl chloride hydrochloride prepared as in example 20 (116 mg) was added. The mixture was stirred overnight at room temperature, diluted with EtOAc and the solution washed with aqueous NaHCO_3 and brine. After drying (MgSO_4), volatiles were removed under reduced pressure. The residue was dissolved in AcOH (3 mL) and the solution heated to 80 °C for 1 h. After cooling to room temperature, the reaction mixture was poured into water and basified to pH 9 by addition of solid K_2CO_3 . The organic phase was then extracted with EtOAc, washed with brine and dried (MgSO_4). Removal of the solvent gave a residue that was purified by flash chromatography on silica gel using 0 to 5% MeOH in EtOAc to give the title compound of example 43 (68 mg).

EXAMPLE 44

7-Methoxy-1H-indole-6-carboxylic acid methyl ester:

15

Step 1: 4-methylsalicylic acid (32.1 g, 0.21 mol) and potassium carbonate (61.2 g, 0.44 mol) were suspended in acetone (300 mL) and the mixture brought to reflux temperature. Dimethyl sulfate (66.5 g, 0.53 mol) was added dropwise within 1 h and stirring continued overnight at reflux. Additional dimethylsulfate (30 mL) and potassium carbonate (2 X 15 g) were added and refluxing for an additional 24 h was required to complete the reaction. The reaction mixture was then cooled to room temperature and inorganic salts removed by filtration using acetone for washings. The filtrate was evaporated under reduced pressure and the oily residue was dissolved in MeOH (300 mL). Concentrated ammonium hydroxide (90 mL) was added and the mixture was stirred for 30 minutes at room temperature. Methanol was removed in vacuo and the residue portioned between ether (300 mL) and water (200 mL). The organic phase was separated and washed with brine and dried (Na_2SO_4). Evaporation of the ether gave the desired di-methylated product as a yellow oil (38.1 g) that was used directly in the next step.

Step 2: The ester from above (38.0 g, 0.21 mol) was dissolved in AcOH (250 mL) and bromine (37.2 g, 0.23 mol, 1.1 equiv.) was added dropwise over 30 min with stirring at room temperature. After completion, the reaction mixture was stirred for an additional hour, at which point TLC analysis indicated complete conversion. The reaction mixture was poured into water (1 L) and solid Na₂CO₃ was added cautiously with stirring until the mixture was neutral. The off-white precipitate that formed was collected by filtration, washed with water and dried to give the desired bromo derivative (47.2 g).

Step 3: The bromo derivative from above (44.5 g, 0.17 mol) was added in small portions to conc. H₂SO₄ (170 mL) and the mixture was stirred in an ice-salt bath until all solids dissolved. Conc. HNO₃ (17 mL) was then added dropwise over 20 min and stirring continued for an additional hour in the ice bath. The reaction mixture was then slowly added to ice-water (2 L) and the precipitated yellow solid was collected by filtration. The solid was washed with water, NaHCO₃ solution and water again. After drying, the desired nitro derivative was obtained as an orange solid (36.8 g).

Step 4: The product from above (129.0 g, 0.42 mol) was dissolved in DMF (400 mL) and DMF-dimethyl acetal (151.6 g, 1.27 mol, 3 equiv.) was added in one portion. The mixture was heated at 110-120 °C under an argon atmosphere until conversion was judged complete by TLC (24 h). The reaction mixture was cooled to room temperature and volatiles removed under vacuum to give a dark colored residue (~180 g). Trituration from ether-THF gave the desired enamine as red crystals (72 g).

Step 5: The enamine from above (72.0 g, 0.20 mol) was dissolved in a mixture of THF (600 mL) and MeOH (600 mL). The dark red solution was heated to 30 °C and Raney-Nickel (18 g) was added to the solution. Hydrazine hydrate (11.6 g, 0.23 mol, 1.15 equiv.) was then added dropwise over 30 min. The reaction temperature was increased to 50 °C and a second portion of hydrazine hydrate (11.6 g, 0.23 mol, 1.15 equiv.) was added over 30 min. After stirring overnight at 50 °C, additional Raney-nickel (20 g) and hydrazine hydrate (11.6 g, 0.23 mol, 1.15 equiv.) were added and after stirring for another 7 h at 50 °C, the reaction was judged complete by TLC. After cooling, the catalyst was removed by filtration through a pad of celite and the filtrate was evaporated under reduced pressure. The dark brown residue was dissolved in EtOAc (3 L) and the solution washed with water (1.5 L), 10% HCl (1 L) and brine (700 mL). After drying (Na₂SO₄), removal of solvents gave the desired bromoindole derivative as a brown solid (35 g).

Step 6: The bromoindole derivative from above (35 g) was dissolved in MeOH (1 L) and triethylamine (16.3 g, 1.2 equiv.) was added followed by 10% Pd/C (1.06 g). The mixture was stirred under hydrogen (35 psi) until completion of the reaction (7 h). The catalyst was then removed by filtration and volatiles removed under reduced pressure. The residue was dissolved in EtOAc (700 mL) and the solution washed with 10% HCl (300mL), water (350 mL), NaHCO₃ (350 mL) and brine. The solution was dried (Na₂SO₄) and concentrated under reduced pressure to give the desired indole as a light brown solid (25 g).

This indole derivatives was saponified under standard conditions and elaborated to final inhibitors as previously described for analogous derivatives.

EXAMPLE 45**2-(1-Amino-cyclobutyl)-6-methoxy-3-methyl-3H-benzimidazole-5-carboxylic acid methyl ester**

Methyl 2-methoxy-5-nitrobenzoate (6.21 g, 29.4 mmol) was suspended in MeOH (100 mL) and 20% Pd(OH)₂/C (500 mg) was added. The mixture was stirred under a hydrogen atmosphere (1 atm) for 18 h. The catalyst was removed by filtration and the solvent evaporated under reduced pressure (5.256 g).

The aniline from above (5.23 g) was dissolved in THF (50 mL) and acetic anhydride (2.984 g) was added. The mixture was stirred overnight at room temperature. The white suspension was concentrated under reduced pressure to a white paste, *tert*-butylmethyl ether (TBME, 20 mL) was added and while stirring, hexane (100 mL) was added slowly. The suspension was then stirred for an additional 2h and the solid collected by filtration. The product was washed with hexane and dried in air (6.372 g).

- 90% Nitric acid (9 mL) was diluted with water (9 mL) and cooled to 0 °C. The anilide from above (5.905 g) was added in one portion and the mixture stirred for 30 min in the ice-water bath. The reaction mixture was then added dropwise to ice-water (700 mL) and the precipitated yellow solid was collected by filtration, washed with water and dried in air. The orange solid (5.907 g) was shown by ^1H NMR to consist of a 2:1 mixture of compounds. Extraction of the aqueous filtrate from above with EtOAc gave an additional 1 g of material that was combined with the first crop and purified by flash chromatography on silica gel using 015% EtOAc in CHCl_3 as eluent. An orange solid (4.11 g) was obtained (one isomer).
- 10 The nitroanilide from above (3.580 g) was dissolved in THF (50 mL) and the solution cooled in ice. Iodomethane (4.155 mL, 66.7 mmol, 5 equivalents) and sodium tert-butoxide (6.414 g, 66.7 mmol, 5 equivalents) were added in two portions at a 3.5 h interval. Stirring at room temperature was continued for an additional 20 h after the second addition. THF was evaporated under reduced pressure and water (100 mL)
- 15 was added. The deep red solution was washed with TBME (100 mL). The aqueous phase was acidified with conc. HCl and extracted with EtOAc (2 x 100 mL). The combined organic extracts were dried and concentrated to a dark red powder (3.78 g) that was used directly in the next step.
- The free carboxylic acid (3.75 g) was suspended in 8M HCl (100 mL) and the
- 20 mixture stirred at 100 °C for 8 h. After cooling to room temperature, volatiles were evaporated under vacuum and the residue was co-evaporated 3 times with MeOH. The residue was suspended again in MeOH (100 mL) and cooled in ice-water. Thionyl chloride (5.10 mL, 5 equivalents) was added dropwise and the suspension stirred at 65 °C for 4 h. Volatiles were removed under reduced pressure and the
- 25 residue co-evaporated twice with MeOH (100 mL) and then toluene (2 x 100 mL). The residue was then dissolved in MeOH (200 mL), 20% $\text{Pd}(\text{OH})_2/\text{C}$ (500 mg) was added and the mixture stirred overnight under 1 atm of hydrogen gas. The catalyst was then removed by filtration and the solution evaporated to dryness. The residue was dissolved in EtOAc and the solution washed with aqueous NaHCO_3 and dried
- 30 (MgSO_4). Removal of solvents gave a solid that was suspended in TBME (50 mL) and heated to 60 °C for 30 min. An equal volume of hexane was then slowly added to the hot solution and the precipitated material was collected by filtration, washed with TBME-hexane and dried (2.00 g).
- The diamine from above (1.950 g) was dissolved in DCM (50 mL) and the solution
- 35 cooled in ice. 1-Aminocyclobutyl chloride hydrochloride prepared using a similar

procedure as in example 20 (1.50 g) was added in 3 portions over a 1.5 h period. The mixture was then warmed to room temperature and stirred overnight. Additional acid chloride (0.50 g) was added and stirring continued for another 2 h. DCM was evaporated under reduced pressure and AcOH (30 mL) was added and the mixture
5 heated to 80 °C for 3 h. The reaction mixture was cooled to room temperature and volatiles evaporated under reduced pressure. The residue was dissolved in water (100 mL) and solid NaHCO₃ was added in portions until a pH of 8 was reached. The product was then extracted with EtOAc (3 x 100 mL), dried (Na₂SO₄) and concentrated to dryness. The residue was purified by flash chromatography on silica
10 gel using 0 to 15% EtOH in EtOAc as eluent. The title compound of example 45 was obtained as a grey powder (1.05 g).

INTERNATIONAL SEARCH REPORT

International application No.
PCT/CA2004/000018

Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 56-60 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
